

The first Italian digital environment for Carbon-related data and dynamics

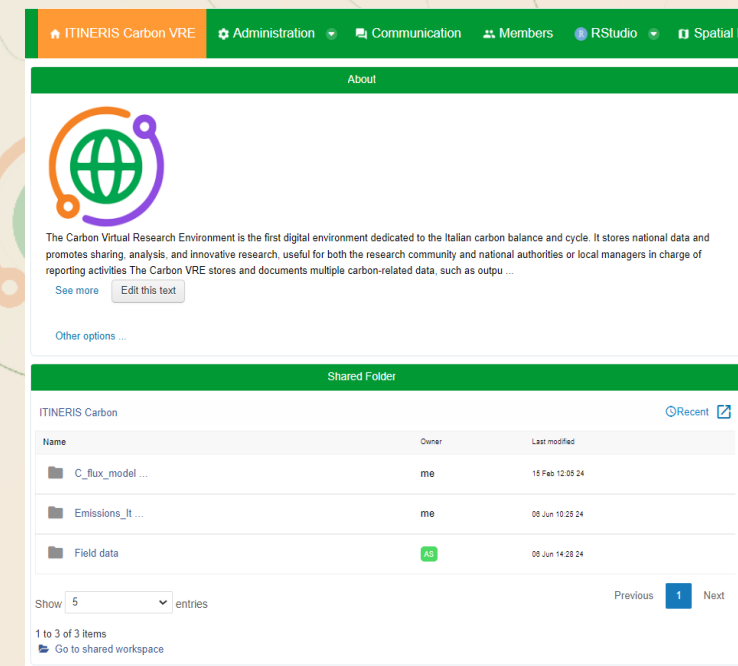

The service was delivered and includes:

- Italian Carbon and ecosystem fluxes
- Italian emission data
- Tools and facilities for analyses
- Research field data and models

Promotes data sharing, analysis, innovative research

End user-oriented: facilitates reporting for administrations

https://itineris.d4science.org/group/itineris_carbon

The main VRE Carbon sections:

- (i) **Above Ground Biomass**: carbon stocks for Trento province, Tuscany, and maps for the Pantropical biome;
- (ii) **Atmospheric Inversion Models**: sample products from 6 models, infographics, and R code;
- (iii) **Carbon Fluxes Models**: sample products from 3 models plus infographics and R code;
- (iv) **GHG Emissions Italy**: sample products from EDGAR and ISPRA with code and infographics
- (v) **Local Research**: data from local level research;
- (vi) **SOCAT Ocean Data**: sample products and references;
- (vii) **Test Isoscape**: isotope data and code, under development. In addition the An Instruction folder provides info on how to manage and upload contents in the VRE.

Mycorrhizal symbioses and tree diversity in global forest communities

Event: Remote Sensing, 2024, Edinburgh, United Kingdom

The VRE C supported several research activities, e.g. linking Carbon-related resources with:

- Habitat Biodiversity
- Ecosystem Functional Properties at ICOS sites
- Pan-tropical forest trait variations
- Forest health

Remote Sensing Applications: Society and Environment

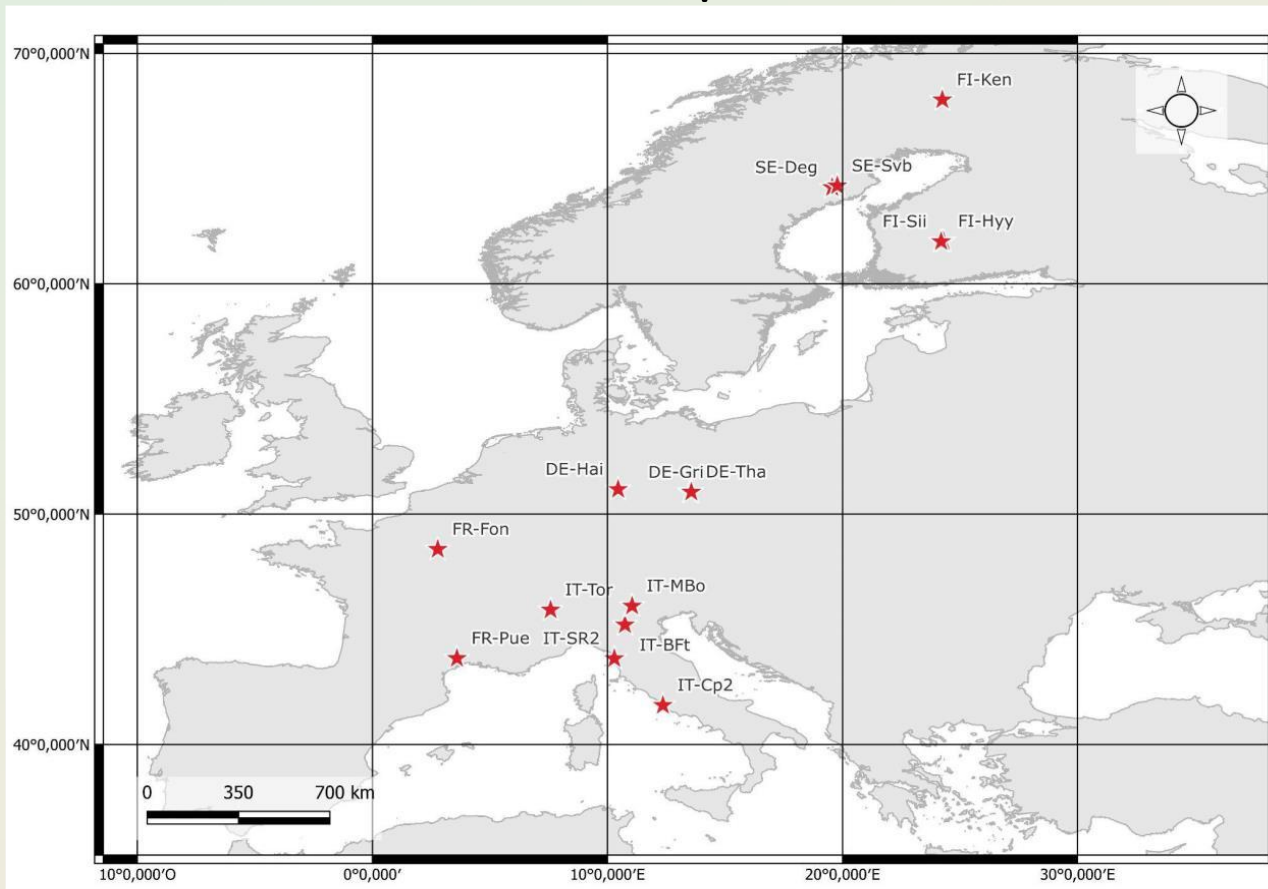

Volume 36, November 2024, 101329

Monitoring ink disease epidemics in chestnut and cork oak forests in central Italy with remote sensing

Alessandro Sebastiani ^a, Matteo Bertozzi ^c, Andrea Vannini ^b, Carmen Morales-Rodriguez ^b, Carlo Calfapietra ^a, Gaia Vaglio Laurin ^{a, b}

- 1 **Ecosystem Functional Properties estimated from satellite PRISMA and**
- 2 **Sentinel-2 data over different European sites and plant functional types**
- 3 *Gaia Vaglio Laurin¹, Lorenza Nardella², Alessandro Montagni³, Alessandro Sebastiani⁴,*
- 4 *Bartolomeo Ventura⁵, Alessandro Mei⁶, Carlo Calfapietra², Dario Papale¹*

EFPs from 15 sites, with different plant function types, were modeled using PRISMA hyperspectral and Sentinel-2 multispectral satellite data.

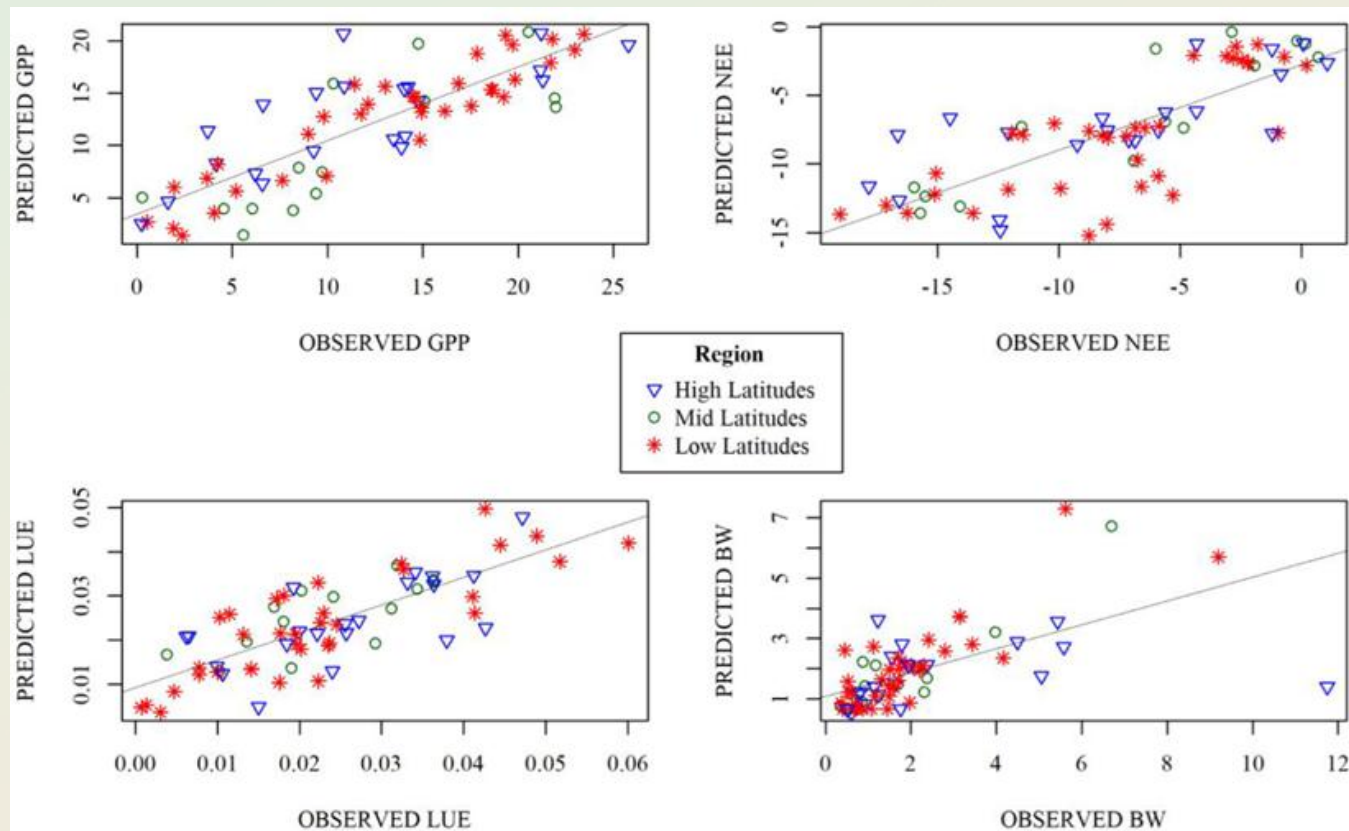

Ecosystem Functional Properties (EFPs), computed from flux tower data, provide a dynamic view of ecosystem carbon and energy related processes (GPP, LUE, WUE, NEE etc.)

EBF = Evergreen Broadleaf Forest (2 sites);
ENF = Evergreen Needleleaf Forest (5 sites);
DBF = Deciduous Broadleaf Forest (3 sites);
GRA = Grassland (3 sites);
WET = Wetland (2 sites)

Comparisons:

Random Forests vs. XGBoost
PRISMA vs. S2 as input data

- Best models with PRISMA (R2: GPP 0.71; NEE 0.61; LUE 0.62; BW 0.37; WUE 0.03)
- XGBoost similar results but many parameters to be tuned
- Sentinel-2 lower results (R2: GPP 0.65; NEE 0.55; LUE 0.58; BW 0.5; WUE 0.03)

- No impact of PFT: model is independent from ecosystem type
- No impact of latitude
- SWIR bands are relevant especially for LUE; WUE is an issue also in other studies
- Next tests on larger datasets; with mixed effects models to recheck PFT role; after disturbance
